Guinea pig ileum is a smooth muscle preparation of small intestine and is known to involve in peristaltic activity.

Peristalsis (stalsis meaning constriction), is a progression of coordinated contraction and relaxation of circular and longitudinal layers of muscle, which pushes a food bolus onwards.

These movements depend mainly on intestinal distension, which initiates nerve impulses to the enteric plexuses and to the CNS. Enteric reflexes and returning parasympathetic impulses from the CNS increase motility. Sympathetic reflexes however, decrease intestinal motility.
