Abstract: In current era, an event is an entity that happens at a point in specific interval. The main motive of this web based application is to construct and come up with an absolute software solution to prearrange-Events, to negate events, to preserve customer data and to save the valuable time of customer. To make the customer experience of using this software in a delight one. The system manages all the events which should be conducted in Wedding/Reception. This system provides latest notification to its customer. This system very fluently store, maintain and retrieve data from its database and can be used for further analysis (Data Mining, Machine Learning and Artificial Intelligence). All the data is tabulated in the database and the user is given a identification number for his booking. And then the data is send to administrator and they interact with the client as per requirement. Once the customer set foot in an event type that is (wedding/Reception, Birthday party), the application then permit the customer to prefer the date and time of particular interest, place and the event equipment's. The best way to look into this web based application is the, artificial intelligence. Artificial intelligence has been widely benefits in many of fields, and our application is one of among. In this system many of the data mining and artificial intelligence techniques had been used for the superior outcome.
